

Smart Scale Solution

Overview

IoT Scale is a device that remotely monitors changes in mass. It can be applied to various applications, such as the usage for raw materials inside containers. Weight data measured will be sent to the cloud portal for display and recording purposes, and can easily be converted to different presentation methods (e.g. consumption percentage). Alerts can be sent to the manager/administrator once materials inside reaches a low level. This recorded data can also help to generate insights on consumption behavior, dosage and refill rate.

Features

- Electronic scale
- Update the weight to cloud instantly
- Easy to install, battery operated
- Measurement history reporting
- Cloud portal display
- Abnormal situation alert

Systems

- Electronic scale
- NB-IoT module

Target Applications

- Weight logging
- Smart monitoring
